one madison avenue, burnaby, bc, canada

In this project a series of residential towers required a design solution that would allow for safe collection and disposal of storm water from all paved and roofed areas of the site into the adjacent, sensitive fish-habitat creek. After an extensive environmental impact assessment, the design solution provides for a series of bio-filtration ponds and that allow for the required storm water purifying process. In addition, the newly created natural buffer created a wildlife and bird habitat.
